

How to use proxy

The easiest way to use proxy is to copy `proxy.providers.txt` to the directory: `~/.pulsar/proxy/providers-enabled`. The file `proxy.providers.txt` contains the url to fetch proxies from external proxy vendors.

Currently, we support two external proxy vendors: `zmhttp.com` and `dailiyun.com`, other vendor supports will be added later.

Another alternative is to put `proxy.providers.txt` in your user home directory, which is `~` under Linux or `%USERPROFILE%` under Windows, and use script `proxymgr` to enable/disable/list the proxies:

```
# Enable all proxy providers
bin/tools/proxy/proxymgr epd -all
```

```
# Disable all proxy providers
bin/tools/proxy/proxymgr dispd -all
```

Run the script for help:

```
bin/tools/proxy/proxymgr
```
